VersionOne announced a strategic partnership with OpsHub, a provider of application lifecycle management (ALM) migration and integration solutions. Leveraging OpsHub Integration Manager, VersionOne is further extending the broadest open ALM platform, providing cross-functional teams with the data and tools needed for efficient project execution and management.

"Organizations with cross-functional teams require development environments that not only provide a robust toolset, but also improve visibility and collaboration across the agile lifecycle," said Sandeep Jain, president and CEO of OpsHub. "Our partnership with VersionOne brings a single integration solution to market that meets all of these needs."

The VersionOne platform with OpsHub Integration Manager brings more than 15 additional deep ALM tool integrations into an already extensive software development ecosystem. The result is the broadest open integration platform on the market. VersionOne's highly configurable centralized management hub allows customers to operate more efficiently across functional teams by improving visibility across all systems.

"VersionOne's partnership with OpsHub reinforces the VersionOne mantra 'Agile Your Way,'" said Paul Culling, vice president of alliances at VersionOne. "The additional integrations resulting from this partnership further VersionOne's goal of helping organizations build true best-of-breed ALM platforms to fit their specific needs. As software organizations move away from single-vendor ALM stacks to best-in-class tools for each activity within the development lifecycle, VersionOne delivers an open platform that allows our customers to realize the full benefits of the agile development lifecycle."

OpsHub Integration Manager unifies ALM systems, allowing for deep technical integration, including the ability to customize their development environment with tools that meet the needs of cross-functional teams. With this partnership, VersionOne now supports more than 45 open source and commercial integrations.
