TargetProcess is an agile project management tool that allows to follow a Scrum, Kanban or customized approach. Version 3.2.2 provides improvement like forecast in timelines, default project/team context, bugs for feature in lists, mode-specific card sizes etc.

Timeline: Forecast for Feature, User Story, Bug, Task, Request, Project, Release, Iteration, Team Iteration

Meet the brand new feature for Timeline view mode: Forecast. The Forecast will give you an idea as of when some entity is likely to be completed. The forecast timeframe is calculated by a linear extrapolation from the two points: start and current date. This timeframe is shown on Timeline to the right of the Current Date's vertical green line as a semi-transparent rectangle. Note that Forecast will only be calculated for Feature, User Story, Bug, Task, Request, Project, Release, Iteration, Team Iteration with 7+ days actual duration time and with more than 10% progress. Forecast can be switched on/off in the Timeline options tab. S

List View: an option to inline edit user story for Bugs / Tasks / Test Cases

Wanting to make List views even more comfortable to work with, we added the option to inline edit a parent User Story for Bugs, Tasks and Test Cases. There's no need to switch to Details view any longer, just click the User Story field right in the List view and pick a user story from the lookup screen.

Lists: Bugs available in Features

Bugs are now available in the 4th level of hierarchy for Features in Lists. If you pick Feature as a card in List view mode, Bugs will be displayed along with User Stories.
