As you move ahead, keep in mind the following:

- * Never confuse the map with the journey - The project plan is only an outline (and a guess at that), so you should believe the team's results and not the plans. Remember, it is the achievement of the objectives that is important, not the production of artifacts or the completion of activities. Be careful not to confuse the ends (objectives) with the means (artifacts and activities).
- * Adopt the attitude that continuous planning is a good thing - In every iteration, expect your plans to change (albeit in small ways if your planning is effective). Don't fall into the trap of thinking that the plan is infallible.
- * Mature your process alongside your team - Tune the working practices alongside the plans, adapt your team's skills as necessary to improve over time.
- * Be prepared to cut your losses - Canceling bad projects early is success because you save time, money and resources that can be applied to better opportunities.
- * Be honest - Without objectivity and honesty, the project team is set up for failure, even if developing iteratively. [Source: "Managing Iterative Software Development Projects", Kurt Bittner, Ian Spence, Addison Wesley](#). Transitioning from a traditional approach to iterative software development is more a change of mind than a schedule adjustment. So try to be honest… or at least as honest as you can be ;o)
