The Agile Software Tester is a key member of the team responsible for software development, test and evaluation efforts supporting the Developer Platform. The primary responsibility of this role is to support Agile/Scrum software development through planning, designing, developing and executing various software quality processes within the Scrum methodology as implemented in the Developer Program. Key accountabilities include implementation of best practice techniques for test-driven development, value-based exploratory testing, automated functional and regression testing. In addition, this role will facilitate internal/external communication between the development team and Acceptance Test stakeholders, as well as validate that the development team adheres to established Agile Testing methodologies and processes.
