

Sonar Plugin Cobol 1.8 Released

Press Release

Posted by:

The SonarSource's Cobol product is a language extension to the Sonar platform, that enables code quality analysis (rules and metrics) on Cobol programs (IBM, Microfocus, Acucobol, GCOS, etc.).

This new version provides support for HP dialect, provides the ability to access to the COPY preprocessing directives from the AST, makes the cobol widget support differential views and ability to recover from a SQL parsing error, plus several improvements and bug fixes.

Trial version and documentation are available in the product page:
